Interview Questions

1. How do you define psychological stress within your research framework?
2. What types of stress induction methods have you used in your studies?
3. Why did you choose these specific stress induction techniques?
4. Are your stress induction experiments conducted in laboratory settings, online environments, or both?
5. How are the stress induction tests currently implemented in your research?
6. Do you use separate platforms, software, or manual setups for different stress tests?
7. Have you encountered any challenges when switching between different stress induction tools or platforms?
8. How do you record participants responses and reaction times?
9. Is the reaction data automatically synchronized with the test stimuli, or is it recorded manually?
10. Have you experienced issues such as:
    a. Inconsistent data formats?
    b. Time-consuming data compilation?
    c. Data loss or corruption?
    d. Human error during recording?
11. In your opinion, is there a need for a centralized platform that integrates multiple stress induction methods into one system?
12. How would a centralized web-based system benefit your research process?
13. Would integrating Stroop Test, MIST, and TSST Arithmetic Task in a single platform improve efficiency?
14. Would integrated video recording of participant reactions enhance your research data quality?
15. Do you believe a centralized platform would reduce human error in stress research?
